

More Sugars = More
Gas
Ethanol

Enzymatic Treatment

creating more sugars to generate more gas

The plant fibre is a polymer chain of sugars,
by breaking, it becomes available to bacteria.

**All will
eventually
use it.**

- Each enzyme acts on specific components of plant fibres, making them effective for targeted applications.
- Enzymes are crucial in various industries for optimizing processes like fermentation, juice extraction, and feed formulation.
- Advances in enzyme technology enhance efficiency and sustainability in processing plant materials.
